AIKIA.WALLET / PRODUCT STRATEGY

One wallet.
More reasons to return.

A vertical expansion blueprint for cafes, salons, pickleball and padel clubs, turf venues, and indoor games.

From a digital loyalty card to a configurable membership and repeat-visit layer for appointment, booking, and play-based businesses.

Working thesis
Keep the wallet, member record, reward rules, staff tools, and reporting common. Configure the action, benefit, timing, and booking handoff for each vertical.

Team working blueprint | October 2026
Internal strategy document. Concepts and offers require validation with pilot venues.

Expand by behavior, not by industry label.

The product should follow repeat behavior: a visit, appointment, booking, session, class, game, or event. A wallet pass helps a venue recognize a member and carry their status and benefits. The booking, payment, waiver, and POS systems remain their own systems of record unless and until a deliberate integration is built.

Recommended position: aikia.wallet helps local experience businesses turn one-time customers into recognized members and repeat bookings. Start with one narrow, measurable loop per venue.

SHARED PRODUCT CORE

Branded member pass; QR enrollment; consent; configurable qualifying action; tier/reward rules; staff lookup and recording; owner dashboard; ledger and reporting.

VERTICAL CONFIGURATION

Change what counts, when a reward is earned, which benefit matters, and where the member goes to book or buy.

AIKIA SERVICE LAYER

Program design, pass setup, creative, staff training, campaign calendar, reporting, and iteration. The software is the tool; the managed program is the service.

WHAT THIS IS NOT

Not a full salon POS, sports-booking engine, payment wallet, medical record, waiver platform, or ticketing system. Do not imply those capabilities.

The first expansion bets

Priority	Category	Why it fits	Initial product shape
1	Salons / barbers	Appointment-led repeat visits; clear rebook behavior; simple service bundles.	Visit or service-count membership with a rebooking link.
2	Pickleball / padel / paddleball	Recurring court play, open play, leagues, off-peak capacity.	Member pass with booking handoff, session packs tracked as eligibility only, and team campaigns.
3	Turf / indoor games	Group bookings and repeat sessions; captains can bring teams back.	Team/member program with captain-led invitations and off-peak offers.
4	Cafes / food venues	Original wedge and simplest repeat-purchase loop.	Keep as reference vertical and use for product validation.

One core, four configurable layers.

Keep the underlying member and transaction model consistent while allowing the venue to configure labels and rules. New verticals should be solved through configuration before custom code.

Layer	Common capability	Venue-specific settings
Identity	Venue-branded pass, member ID, QR/scan token, join page.	Logo, colors, name, language, membership description.
Qualifying action	Append-only record of a completed, eligible action.	Coffee purchase, completed appointment, attended class, completed court/game session.
Program rules	Progress, tier, benefit eligibility, redemption and audit history.	Thresholds, expiry, exclusions, reward, peak/off-peak rules.
Engagement	Consent-based member communication or campaign workflow.	Audience, reason, channel, frequency, send window, offer cap.
Operations	Owner setup, team roles, staff scan flow, exports, support.	Staff instructions, approval needs, booking/POS handoff, service cadence.
Measurement	Baseline, cohort, repeat activity, reward cost and retention.	Metric definitions, comparison window, venue targets.

Product principle

A pass is a compact membership surface, not the complete experience. For booking-heavy businesses, the member can tap a clearly labeled action such as **Book again** or **View my session** that opens the venue's booking flow. Until integrated, booking confirmation and payment stay with the venue's booking tool. Google Wallet supports pass types and class/object models for member-specific details; exact fields and provider behavior must be verified during implementation. Apple Wallet remains a separate future adapter in the current project.

> **Do not sell booking automation, appointment reminders, entry validation, dynamic inventory, prepaid balances, or push campaigns until each flow is built, tested, and approved for the target venue.**

Salons and barbers

A salon program should increase the next completed appointment and make rebooking easy. It should not pressure guests into unnecessary treatments or expose sensitive service details on a lock screen.

Best-fit buyers

Independent salons, barbers, nail studios, beauty studios, and small multi-location operators with repeat clients, a usable appointment book, and an owner or manager able to champion the program.

MEMBER ACTIONS	MEMBER BENEFITS
Completed visit; eligible service family; visits within an agreed time window; referral who completes a first appointment. Count only after the appointment is completed, not when booked.	A complimentary add-on after a threshold; priority booking window; birthday benefit; member-only event; product credit with explicit terms; refer-a-friend reward.
AIKIA SERVICES TO OFFER	**AVOID**
Program design; wallet pass setup; service-safe creative; booking-link landing page; staff script and training; monthly campaign calendar; cohort and rebooking report; optional booking-platform integration discovery.	Publicly displaying treatment history; storing health/allergy/skin data; discounting every appointment; awarding rewards for cancelled or no-show appointments; promising more bookings without evidence.

Salon journey

Moment	Guest experience	Salon / aikia operation
After a good appointment	Staff invite the guest to join by QR; guest sees the benefit and consent.	Salon selects one program mechanic; aikia trains desk team.
Before leaving	A discreet Book again link takes the guest to the salon's booking page.	Current booking tool remains authoritative; measure link taps if available.
At next visit	Staff scan or look up the member and record a completed visit.	Require a staff confirmation; protect against duplicate stamps.
At milestone	Guest receives or sees a relevant benefit.	Honor only defined services, dates, and exclusions; track redemption cost.
After lapse	Optional, consent-based reminder with a direct booking link.	Set a frequency cap and suppress recently booked members where possible.

Sample salon offer: Join free; after four completed visits, choose one eligible add-on on the fifth. The salon approves the service list and value. Present this as an example to test, not a default price promise.

Pickleball, padel, paddleball, turf, and indoor games

The product should encourage another booked and attended session. Distinguish membership from court reservation: a wallet pass can identify the player/member, but the facility booking system owns time slots, payment, cancellations, and capacity.

Best-fit buyers

Court clubs, turf operators, indoor cricket/football/badminton venues, bowling or game centers, and multi-activity venues with repeat groups, open play, leagues, or quiet-hour inventory. Prioritize operators with reliable booking records and clear check-in ownership.

PLAYER ACTIONS	MEMBER BENEFITS
Attended booking; completed open-play session; league night attendance; eligible off-peak session; new player referral after attendance.	Priority booking window; member open-play rate; off-peak bonus session; league entry benefit; guest pass; team challenge; birthday or milestone recognition.
AIKIA SERVICES TO OFFER	**AVOID**
Program and tier design; player/member pass; QR check-in or staff lookup; captain/team enrollment kit; booking link or integration discovery; league-season campaign; repeat-play dashboard; off-peak campaign management.	Selling court inventory in the wallet; promising real-time slot sync without integration; reward points for bookings later cancelled; tying access/security to a static screenshot; collecting unnecessary health or minor data.

Two operating models

Model	How it works	Best for	Trade-off
Link-first pilot	Wallet action opens booking system; staff marks attended session in dashboard.	One venue, limited software access, fast learning.	Manual check-in and reconciliation; keep pilot volume low.
Integrated phase	Booking provider sends eligible booking/attendance event to wallet ledger.	Repeatable program with stable booking platform.	Needs API/vendor access, consent mapping, cancellation/refund rules, monitoring.
Venue-run check-in	Staff scans member QR and records attended session against a booking.	Venue with reliable desk or court marshal.	Requires training and a duplicate/fraud process.

A venue-specific example

Off-Peak Rally Club: three attended off-peak sessions unlock one member-priced open-play entry. Bookings remain in the venue's system. The desk verifies attendance, the wallet ledger records the action, and the owner sees return frequency and reward cost. Publish cancellation and expiry terms before enrollment.

For team sports, support both an individual member and a team/captain referral path. Do not assume one person's pass can authorize an entire group.

Build a reusable playbook, then test adjacent categories.

The same program core may fit other businesses, but each needs a distinct completed-action definition, benefit, data boundary, and operational owner.

Category	What the wallet can represent	Potential managed service	Key boundary
Cafe / bakery	Regular, purchase progress, tier or club.	Welcome, off-peak offer, seasonal drop, repeat and lapsed-member reporting.	POS/order data is separate unless integrated.
Salon / barber	Client membership and eligible completed visits.	Rebooking journey, milestone benefit, referral and reactivation.	Avoid sensitive treatment data and over-discounting.
Pickleball / padel / paddleball	Player membership, attended sessions, league tier.	Open-play, team referrals, off-peak fills, season launch.	Booking/court inventory remains in booking system.
Turf / indoor games	Individual or team membership, attended bookings.	Captain outreach, group packages, tournament and quiet-slot campaigns.	Define group capacity and whose action earns credit.
Fitness / yoga / studios	Class attendance or membership milestone.	Attendance streaks, class packs, bring-a-friend, renewal prompts.	Membership billing and health data are outside wallet scope.
Bowling / arcade / escape rooms	Visit membership, birthday or group milestone.	Group invites, off-peak bundles, repeat-event campaigns.	Ticketing, timed entry, and party reservations need their own system.

Expansion filter

REPEAT FREQUENCY

Customers return often enough that recognition or a benefit can matter.

ACTION DATA EXISTS

The venue can confirm a completed visit/session without guesswork.

OWNER HAS A GOAL

There is a specific problem: low repeat, empty hours, dormant members, or weak referrals.

STAFF CAN RUN IT

The check-in flow fits the desk, coach, stylist, marshal, or cashier workflow.

REWARD ECONOMICS WORK

The venue can afford the benefit and estimate its marginal cost.

TRUST IS MANAGEABLE

Consent, data use, minors, refunds, and venue terms can be handled clearly.

Do not expand into a category just because it accepts bookings. Target venues where the wallet can create a measurable repeat relationship and where the operator can execute the program.

What aikia can sell to a venue

Package the work as a managed retention program. Separate what is live now from optional services that depend on integrations or additional product work.

Service	Included work	Value to venue	Aikia value
Program strategy & setup	Goal, audience, qualifying action, reward economics, terms, pass branding, join flow.	A program designed around its actual customer behavior.	One-time setup revenue and a repeatable onboarding method.
Wallet membership	Branded pass, enrollment QR, member record, progress/tier and benefit rules.	A recognizable membership surface and simple join path.	Recurring software/service relationship.
Staff enablement	Role-based flow, one-page SOP, training, exception handling.	Less confusion at checkout, front desk, or check-in.	Reduced support burden and stronger adoption.
Campaign operations	Monthly calendar, eligible audiences, creative and offer cap.	Consistent, targeted reasons to return.	Recurring managed service; campaign insights.
Reporting & review	Baseline, visits/actions, repeat cohorts, redemptions, offer cost, opt-outs.	Visibility into whether the program is working.	Proof, renewals, and informed iteration.
Booking/POS discovery	Map current systems, event definitions, vendors, data permissions and integration cost.	Clear path to reduce manual steps.	Paid discovery or scoped implementation.
Custom integration	Only after provider access and event semantics are confirmed.	Less duplicate entry and better attribution.	Project revenue and potential differentiated capability.

Commercial shape (no rates set here)

Use a **setup fee** for discovery, configuration, creative, onboarding and training; a **monthly platform/service fee** for hosting, support, reporting and an agreed number of campaigns; and a **separate scoped project fee** for non-standard integrations or custom work. Pass through third-party charges transparently. Avoid revenue-share or guaranteed-lift pricing until attribution and legal terms are clear. Current commercial prices need a single approved rate card before buyer distribution.

Make the value legible for both sides.

The wallet itself does not create retention. A relevant offer, a reliable staff process, and a measured baseline do. Sell the operating system around the pass, not an unsupported growth guarantee.

For the venue	How value can show up	What to measure
Recognize repeat customers	Member share of completed visits; staff recognition; member vs nonmember return frequency.	Eligible visits, active members, repeat interval.
Use quiet capacity	Limited, member-only off-peak offer.	Incremental attended sessions, unused capacity, reward cost.
Improve rebooking	Post-visit link to existing booking page; reminder only where consent and tools allow.	Rebook click, completed booking, attendance, cancellation/no-show.
Encourage referrals	Give/get reward after referred guest completes a first visit.	Referrals, completed first visits, reward cost.
Learn which benefit works	Compare simple cohorts or periods, with caveats.	Redemption, contribution margin, opt-out, repeat lift vs baseline.

For aikia

REVENUE

Setup plus recurring managed service; integration projects priced and scoped separately.

RETENTION

A recurring program creates ongoing owner touchpoints and a reason to renew.

LEARNING

Cross-vertical configuration reveals which features are common and which deserve product investment.

PROOF

Measured pilots can create credible case studies after owner consent and adequate data.

Simple economics worksheet

For each proposed reward, estimate: (eligible redemptions x marginal reward cost) + campaign and support time + platform/provider costs. Compare this with contribution margin from additional completed visits, reduced empty-slot loss, or prepaid cash only if legally approved. Separate observed revenue from estimated incremental revenue. A comparison period is not proof of causation; use a holdout or matched cohort where practical.

Venue success is not the number of passes issued. It is a repeat behavior that improves at acceptable cost, with a guest experience the venue is proud to offer.

Keep the pass simple. Give each role the right next action.

The current product direction is Google Wallet first, with a provider boundary intended to support a later Apple Wallet adapter. The product should avoid pretending that a pass is a booking confirmation or secure entry credential unless that flow is explicitly implemented.

Surface	What it should show	Vertical adaptations
Member pass	Venue brand; member name/code as appropriate; progress/tier; one useful action; concise terms.	Salon: Book again. Court club: Book a court / View schedule. Cafe: View reward.
Enrollment page	Program explanation; minimum needed fields; consent and terms; wallet add step.	Collect booking/member ID only if needed and explained.
Staff view	Scan or lookup; confirm venue/member; record eligible action; show success/error; redemption confirmation.	Prompt for completed visit, attended session, or approved purchase.
Owner dashboard	Program status; member list; activity ledger; benefit rules; team access; campaign and report.	Report per location, provider, service type, class/session, or daypart only when data exists.
Booking handoff	Clear link to venue booking tool, prefilled only if secure and supported.	Do not copy sensitive booking details into a pass or expose private schedule data.

Screen hierarchy

- **Member:** identity and next best action first; reward progress second; terms and help easy to find.
- **Staff:** scan, verify, record, confirm. Do not make staff navigate a marketing dashboard to give a reward.
- **Owner:** a clear program health view, not a vanity counter. Show repeat cohorts and offer cost alongside enrollment.
- **Admin/aikia:** configuration, venue support, provider status and exception review.

Accessibility: use high contrast, large scan controls, clear text alternatives to color tiers, keyboard support for dashboard flows, and a manual fallback when camera or network access fails.

Sell the repeat-behavior problem, then show the flow.

Lead with the venue's real operating gap. Avoid pitching "digital loyalty" as a generic feature or claiming the wallet will automatically fill calendars.

Discovery questions

Question	What it reveals
How often should a happy customer return?	Natural repeat interval and whether a loyalty loop is relevant.
How do you know a visit, appointment, or session happened?	Source of truth and staff workflow.
Where do customers book or pay today?	Handoff vs integration scope.
When is capacity quiet, and what is one empty slot worth?	Potential use case and reward economics.
What brings your best customers back today?	Existing strengths to reinforce.
What reward would feel valuable but still protect margin?	Benefit cost and eligibility.
Who will invite members and verify activity?	Operational owner and adoption risk.
What customer data do you already have permission to use?	Consent and channel constraints.

30-second pitch: salon

"Your best clients already come back because they trust your team. aikia.wallet gives them a simple salon membership in their phone, makes the next booking easy, and gives your desk a consistent way to recognize completed visits. We set up the program, train the team, and review rebooking and reward cost with you. Your booking calendar stays where it is today."

30-second pitch: sports venue

"You already have players who come back every week. We help you recognize them, reward attended play, and run member offers around open-play or quieter slots. The wallet is the membership layer; your booking system still controls court or turf availability. We start with one location and one repeat-play goal, then decide from the numbers whether to expand."

Be candid about boundaries. Earn the pilot.

An honest, narrow pilot is more persuasive than a large feature promise. Use the buyer demo with fictional data only; do not enter real member details into it.

Buyer concern	Response
“We already have a booking app.”	“Keep it. We start with a link from the member pass and a simple attended-action flow. If the pilot proves value, we can scope an integration with your provider.”
“We use a paper card.”	“That may be working. Let us compare join, redemption and repeat behavior for one small group before replacing anything.”
“My staff will not use another system.”	“Then the pilot must fit the existing check-in. We will map the actual steps and stop if we cannot make it low-friction.”
“Can you guarantee more bookings?”	“No. We can set a measurable goal, baseline current behavior, run a limited program, and report what changed.”
“Can the wallet store prepaid credits?”	“That needs a separate product and legal review. The first pilot can use eligibility and rewards without treating the pass as money.”
“Can we message members anytime?”	“Only through a channel and consent the member agreed to, with a useful reason, frequency limits and an opt-out.”
“Can you integrate our software?”	“Possibly. First we confirm the provider, available API/events, permissions, cancellation rules, costs, and who supports it.”

Pilot close

> **“Let us run one small program for one location and one member action. We will agree the baseline, reward cost, staff steps, privacy wording and success measures before launch. At the review date, you decide whether it earned a wider rollout.”**

Pilot agreement should define: venue and cohort; action source; reward terms/cap; staff owner; consent and opt-out; data access; support hours; success measures; review date; exit and data export.

A six-week learning loop

Keep the first cycle small enough to observe end to end. Timing can vary with venue access and provider setup; this is a sequence, not a launch guarantee.

Stage	Team work	Exit evidence
1. Qualify	Confirm owner goal, repeat pattern, booking/POS tool, staff process, data permission, reward margin.	Written problem statement; named champion; data map.
2. Baseline	Agree metric definitions and capture a comparable pre-period. Record seasonality and capacity context.	Baseline snapshot with caveats.
3. Configure	Set pass branding, action, reward, join terms, booking link and staff SOP. Test with internal accounts.	Approved screens and test results.
4. Train	Walk the actual staff through invitation, scan, completion, redemption, exceptions and offline fallback.	Staff sign-off; support contact.
5. Run	Invite a bounded cohort; check ledger and errors daily at first; limit campaign volume.	Enrollment, completed actions, redemption and issue log.
6. Review	Compare against baseline/cohort; calculate reward and service cost; interview staff/owner.	Continue, revise, integrate, or stop decision.

Pilot scorecard

- Activation: invited people who complete enrollment; pass adds vs eligible invitations.
- Adoption: staff-recorded qualifying actions divided by eligible visits/sessions.
- Repeat: members with a second completed action within the defined window.
- Capacity: completed off-peak visits/sessions vs the comparable baseline.
- Economics: reward cost, service effort, platform cost, and observed gross contribution.
- Trust/quality: opt-outs, complaints, duplicate actions, failed syncs, and support incidents.

Trust is part of the product.

Each vertical adds operational and privacy considerations. Use minimum necessary data; explain purpose and retention; apply role-based access; and confirm venue-approved terms before real enrollment.

Risk area	Operating rule
Privacy and consent	Collect only fields needed for membership. Record notice version and consent. Provide opt-out and data correction/deletion route.
Salon data	Do not store diagnoses, allergies, treatment notes or sensitive beauty/health details in wallet fields or campaign audiences.
Sports and minors	Set age policy with venue and counsel. Minimize child data; confirm guardian consent and access rules before youth programs.
Bookings and cancellation	Define whether a booking, payment, check-in, or completed session earns progress. Reverse or hold credit for cancellations/refunds per written terms.
Fraud and staff mistakes	Use opaque scan IDs, authenticated staff, an append-only activity record, idempotent actions, audit trail and exception review.
Prepaid value	Do not issue stored value or cross-venue balances as a casual extension. Obtain appropriate legal/tax review and define redemption/liability.
Messaging	Use only verified provider capabilities. Do not promise push, nearby triggers, SMS/WhatsApp delivery or timing without testing and consent.
Reliability	Provide lookup/manual fallback, sync monitoring, backups, escalation owner and a venue exit/export plan.

Booking ownership rule: the booking platform is authoritative for availability, payment, cancellation and appointment/session state. aikia's ledger is authoritative only for membership actions recorded under agreed rules.

Prove the workflow before broadening the software.

The repository already models generic qualifying actions and venue-specific rewards, and the buyer demo includes editable venue branding and tiers. Current production integration is Google Wallet first; Apple Wallet is a later provider adapter. This blueprint proposes product direction, not a claim that every surface is complete.

Phase	Focus	Gate to proceed
Now: service pilot	Use current configurable action/reward model with link-first booking handoff. Choose one salon and one court/turf operator only if the team can support both.	Manual flow is reliable; owner approves terms; baseline and action source are clear.
Next: vertical templates	Create salon, court club and turf presets for copy, action type, benefit examples, staff SOP and dashboard labels.	Two or more pilots show repeatable setup and venue demand.
Then: provider integration	Select the highest-value booking provider from pilots; build only the event(s) needed: completed/attended, cancellation/refund, member match.	API access, permission, cost, support and test environment confirmed.
Later: richer membership	Team accounts, season passes, class packs, multi-location reporting, optional booking deep links or native Apple Wallet.	Economics, legal and operational reviews passed; roadmap funded.

Team decisions before selling

- Which two categories will be piloted first? Recommended shortlist: one salon/barber and one court or turf operator.
- Which booking/POS systems do those venues already use, and who can authorize access?
- Will the first pilot use completed-visit entry by staff or a booking-system event?
- What is the approved setup/monthly service structure and what support does it include?
- What data do we retain, for how long, who can access it, and how does a venue exit?
- What is the actual provider and production status of Google Wallet today? What is the Apple Wallet delivery plan?

Take this from concept to a credible offer.

Use the following checklist before the first salon or sports-venue sales meeting.

One-page leave-behind should show

- The venue problem and one agreed repeat behavior.
- A visual of the member pass plus the relevant Book again / Book a session action.
- The staff flow in three steps: identify member, confirm completed action, apply benefit.
- A sample owner report with clearly labeled fictional/example data.
- A small pilot scope, exclusions, timeline assumptions and review date.
- Privacy/consent summary and named support contact.

Internal prep checklist

Before demo	Before pilot	Before wider rollout
Choose venue-specific story; use fictional records; rehearse on mobile; verify links; do not show unbuilt booking sync.	Sign scope and terms; approve consent, reward and exclusions; name champion; baseline; staff test; incident fallback.	Review cohort evidence; confirm economics; get publication consent separately; prioritize common integration; update playbook.

Recommended next move

Run discovery with one salon/barber and one pickleball/padel or turf venue. Do not promise integration yet. Map each customer journey, observe staff check-in, and test a link-first membership flow. Choose the first vertical template from evidence, not preference.

Reference basis

Internal product basis: AIKIA.WALLET README and architecture notes; current buyer pitch and sales playbook; archived Master Blueprint and Launch Readiness Blueprint. The archive blueprints are historical where they conflict with the current Google Wallet-first implementation.

Platform references consulted 4 October 2026: Google Wallet developer documentation on pass classes/objects and pass customization; Apple Developer documentation on Wallet loyalty passes. Platform availability and requirements can change; re-check before implementation.
